1 Overview

1.1 Purpose

So far in this class, you have seen how binary or machine code manipulates our circuits to achieve a goal. However, as you have probably figured out, binary can be hard for us to read and debug, so we need an easier way of telling our computers what to do. This is where assembly comes in. Assembly language is symbolic machine code, meaning that we don't have to write all of the ones and zeros in a program, but rather symbols that translate to ones and zeros. These symbols are translated with something called the assembler. Each assembler is dependent upon the computer architecture on which it was built, so there are many different assembly languages out there. Assembly was widely used before most higher-level languages and is still used today in some cases for direct hardware manipulation.

1.2 Task

The goal of this assignment is to introduce you to programming in LC-3 assembly code. This will involve writing small programs, translating conditionals and loops into assembly, modifying memory, manipulating strings, and converting high-level programs into assembly code.

You will be required to complete the four functions listed below with more in-depth instructions on the following pages:

1. `largestOf3.asm`
2. `arrayModify.asm`
3. `leetspeak.asm`
4. `vowelOccurrences.asm`

1.3 Criteria

Your assignment will be graded based on your ability to correctly translate the given pseudocode into LC-3 assembly code. Check the [deliverables section](#) for deadlines and other related information. Please use the [LC-3 instruction set](#) when writing these programs. More detailed information on each instruction can be found in the Patt/Patel book Appendix A (also on Canvas under “LC-3 Resources”). Please check the rest of this document for some advice on [debugging](#) your assembly code, as well some [general tips](#) for successfully writing assembly code.

You must obtain the correct values for each function. While we will give partial credit where we can, your code must assemble with **no warnings or errors** (CompX will tell you if there are any). If your code does not assemble, we will not be able to grade that file and you will not receive any points. Each function is in a separate file, so you will not lose all points if one function does not assemble. Good luck and have fun!

2 Detailed Instructions

2.1 Part 1: Largest of 3 numbers

To start you off with this homework, we are implementing a function that compares 3 numbers and finds the largest one! Store the result of the operation in the label **ANSWER**. Arguments A, B, and C are stored in memory, and you will load them from there to perform this operation. Implement your assembly code in `largestOf3.asm`.

Suggested Pseudocode:

```
ANSWER = 0;
if (a > b) {
    if (a > c) {
        ANSWER = a;
    } else {
        ANSWER = c;
    }
} else {
    if (b > c) {
        ANSWER = b;
    } else {
        ANSWER = c;
    }
}
```

2.2 Part 2: Array Modify

The second assembly function is to implement certain array modifications to an array. You will be modifying an array out of place, meaning that the original array will remain the same and your code will produce a resulting array with said modifications. The resulting array will have enough space for the final answer. Use the pseudocode to help plan out your assembly and implement your assembly code in `arrayModify.asm`.

Suggested Pseudocode:

```
x = 0; // first index of ARR_X
y = 0; // first index of ARR_RES
//assume ARR_X and ARR_RES will be arrays of ints and ARR_X will be of even length

sum = 0; //initial sum

while (x < LENGTH_X) {
    if (x % 2 == 0) {
        //if we are at an even index, update sum
        sum = sum + ARR_X[x];
    } else {
        //if we are at odd index, copy the value from ARR_X to ARR_RES
        ARR_RES[y] = ARR_X[x];
        y++;
    }

    x++;
}

//lastly, place sum of evens at the end of ARR_RES
ARR_RES[LENGTH_RES - 1] = sum;

// the final array should be in ARR_RES
```

2.3 Part 3: Leetspeak

The third assembly function is to modify a **null-terminated** string by replacing 'e' with '3' and 'o' with '0'. In this function, the initial string can be assumed to be lowercase. The index starts at 0. Keep in mind that the ASCII codes for '3' and '0' are not 3 and 0, respectively.

The label **STRING** will contain the **address** of the first character of the string to be converted. Convert the string in-place, so that the result string is also stored at the same label **STRING**. Remember that strings are just arrays of consecutive characters. You are given two constants to use in your program, **LOWERO** which is the value of the ASCII character 'o', **LOWERE** which is the value of 'e'. Keep in mind that you may add more constants if you wish. Implement your assembly code in `leetspeak.asm`

Assume that the strings are random: they can contain characters, numbers, spaces and symbols.

To modify a character, **refer to the [ASCII table](#)** and remember that each of these characters are represented by a word (16-bits) in the LC-3's memory. This is a **null-terminated** string, meaning that a 0 will be stored immediately after the final character in memory!

NOTE:

- 0 is the same as '\0'
- 0 is different from '0'

Suggested Pseudocode:

```
string = "spongebob";

i = 0;

while(string[i] != 0) {
    if (string[i] == 'o') {
        //convert to '0'
        //note that 'o' - '0' is 0x3F in hex
        string[i] = string[i] - 0x3F;
    } else if (string[i] == 'e') {
        //convert to '3'
        //note that 'e' - '3' is 0x32 in hex
        string[i] = string[i] - 0x32;
    }

    i++;
}
```

The result here is "sp0ng3b0b".

2.4 Part 4: Vowel Occurrences

For the final problem, your goal is to determine the number of occurrences of each vowel, (A, E, I, O, U), in a **null-terminated** string. The label **ANSWER** will contain the **address** of the first element of your occurrence array. You will update each vowel's number of occurrences in this array. The first element of the array corresponds to the number of occurrences of 'A' in the string, the second element corresponds to 'E' occurrences, and so on.

The label **STRING** will contain the **address** of the first character of the string to be checked. Remember that this string is **null-terminated**. The result will be stored at the label **ANSWER**. Each element in the array should contain the number of occurrences of its respective vowel in the string. Implement your assembly code in `vowel0ccurrences.asm`

Assume every alphabetic character in the string is in uppercase. The string can contain numbers.

NOTE:

- 0 is the same as '\0'
- 0 is different from '0'

Suggested Pseudocode:

```
string = "A TEN OUT OF TEN IS GREAT";
answer = [0, 0, 0, 0, 0];
len = 0;

A = 0; // index of 'A' occurrences in answer array
E = 1; // index of 'E' occurrences in answer array
I = 2; // index of 'I' occurrences in answer array
O = 3; // index of 'O' occurrences in answer array
U = 4; // index of 'U' occurrences in answer array

while (string[len] != '\0') {
    if (string[len] == 'A') {
        answer[A] = answer[A] + 1;
    } else if (string[len] == 'E') {
        answer[E] = answer[E] + 1;
    } else if (string[len] == 'I') {
        answer[I] = answer[I] + 1;
    } else if (string[len] == 'O') {
        answer[O] = answer[O] + 1;
    } else if (string[len] == 'U') {
        answer[U] = answer[U] + 1;
    }

    len = len + 1;
}
```

3 Deliverables

Turn in the following files on Gradescope:

1. `largestOf3.asm`
2. `arrayModify.asm`
3. `leetspeak.asm`
4. `vowelOccurrences.asm`

Note: Please do not wait until the last minute to run/test your homework. Last minute turn-ins will result in long queue times for grading on Gradescope. You have been warned.

4 Running the Autograder and Debugging LC-3 Assembly

When you turn in your files on Gradescope for the first time, you may not receive a perfect score. Does this mean you change one line and spam Gradescope until you get a 100? No! You can use a handy Complx feature called “replay strings”.

1. First off, we can get these replay strings in two places: the local grader, or off of Gradescope. To run the local grader:

- Mac/Linux Users:
 - (a) Navigate to the directory your homework is in (**in your terminal on your host machine, not in the Docker container via your browser**)
 - (b) Run the command `sudo chmod +x grade.sh`
 - (c) Now run `./grade.sh`
- Windows Users:
 - (a) In Git Bash (or Docker Quickstart Terminal for legacy Docker installations), navigate to the directory your homework is in
 - (b) Run `chmod +x grade.sh`
 - (c) Run `./grade.sh`

When you run the script, you should see an output like this:

```
TEST: testGates PASSED
TEST: testReverse PASSED
TEST: testPhone PASSED
TEST: testLinkedList FAILED

NODES="[(16384, 0, -7)]", DATA="-7", LENGTH="1" -> NODES="[(16384, 0, 1)]": Code did not halt normally.
This was probably due to an infinite loop in the code.
PC: x380f
Instruction last on: BR LOOP

String to set up this test in complx: 'BQEAAAAGAgAAABATBAAAAERBVEEBAAAA+f8VAgAAAEAMagAAAAAQZBAAAAADQwMDABAAAA
DQwMDEBAAAA+f/'
NODES="[(16384, 16392, 7), (16386, 16388, 2), (16388, 16390, 4), (16390, 0, 2), (16392, 16386, 15)]", DATA="15", LENGTH=
"5" -> NODES="[(16384, 16392, 7), (16386, 16388, 2), (16388, 16390, 4), (16390, 0, 2), (16392, 16386, 5)]": Code did not
halt normally.
This was probably due to an infinite loop in the code.
PC: x380f
Instruction last on: BR LOOP
```

Copy the string, starting with the leading 'B' and ending with the final backslash. Do not include the quotation marks.

Side Note: If you do not have Docker installed, you can still use the tester strings to debug your assembly code. In your Gradescope error output, you will see a tester string. When copying, make sure you copy from the first letter to the final backslash and again, don't copy the quotations.

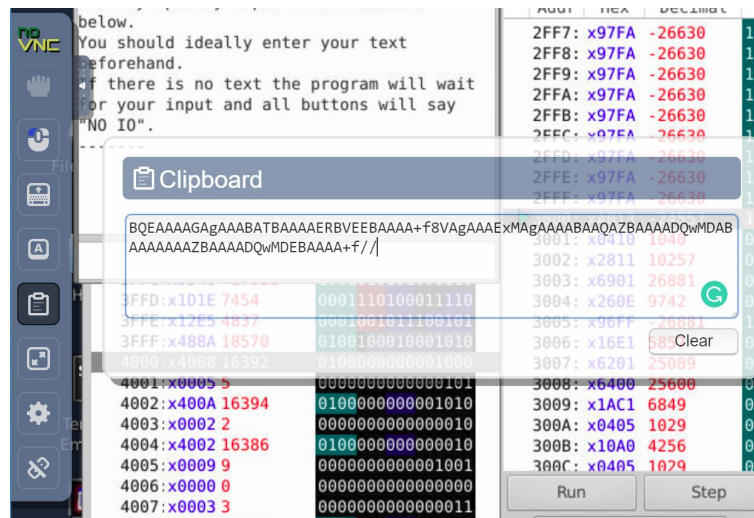

```
LINKEDLIST: testLinkedList (0.0/30.0)

LENGTH="1" -> NODES="[(16384, 0, 1)]": Code did not halt normally.
loop in the code.

'BQEAAAAGAgAAABATBAAAAERBVEEBAAAA+f8VAgAAAEAMagAAAAAQZBAAAAADQwMDABAAAA
388, 2), (16388, 16390, 4), (16390, 0, 2), (16392, 16386, 15)]", DATA="15"
loop in the code.

'BQEAAAAGAgAAABATBAAAAERBVEEBAAAA+f8VAgAAAEAMagAAAAAQZBAAAAADQwMDABAAAA
```

2. Secondly, navigate to the clipboard in your Docker image and paste in the string.

- Next, go to the Test Tab and click Setup Replay String

- Now, paste your tester string in the box!

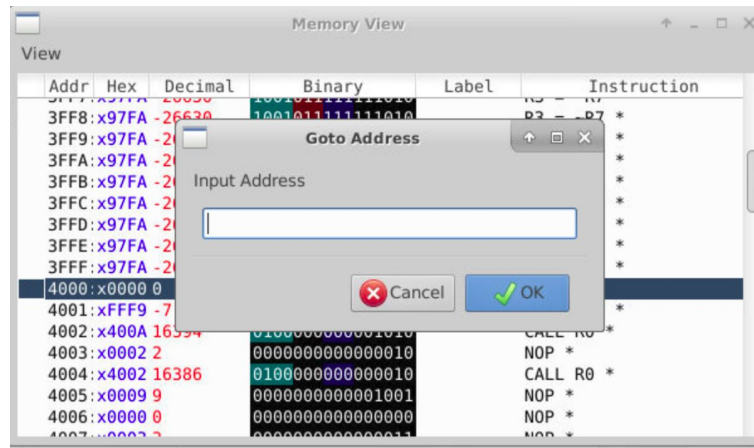

- Now, Complx is set up with the test that you failed! The nicest part of Complx is the ability to step through each instruction and see how they change register values. To do so, click the step button. To change the number representation of the registers, double click inside the register box.

- If you are interested in looking how your code changes different portions of memory, click the view tab and indicate 'New View'

- Now in your new view, go to the area of memory where your data is stored by CTRL+G and insert the address

- One final tip: to automatically shrink your view down to only those parts of memory that you care about (instructions and data), you can use View Tab → Hide Addresses → Show Only Code/Data.

5 Appendix

5.1 Appendix A: ASCII Table

| Char | Dec | Oct | Hex | Char | Dec | Oct | Hex | Char | Dec | Oct | Hex |

|--------------------|---------|
| Keybd Status Reg | xFE00 |
| Keybd Data Reg | xFE02 |
| Display Status Reg | xFE04 |
| Display Data Reg | xFE06 |

5.3 Appendix C: LC-3 Assembly Programming Requirements and Tips

1. Your code must assemble with **NO WARNINGS OR ERRORS**. To assemble your program, open the file with Complx. It will complain if there are any issues. **If your code does not assemble you WILL get a zero for that file.**
2. **Comment your code!** This is especially important in assembly, because it's much harder to interpret what is happening later, and you'll be glad you left yourself notes on what certain instructions are contributing to the code. Comment things like what registers are being used for and what less intuitive lines of code are actually doing. To comment code in LC-3 assembly just type a semicolon (;), and the rest of that line will be a comment.
3. Avoid stating the obvious in your comments, it doesn't help in understanding what the code is doing.

Good Comment

```
ADD R3, R3, -1      ; counter--
BRp LOOP            ; if counter == 0 don't loop again
```

Bad Comment

```
ADD R3, R3, -1      ; Decrement R3
BRp LOOP            ; Branch to LOOP if positive
```

4. **DO NOT assume that ANYTHING in the LC-3 is already zero.** Treat the machine as if your program was loaded into a machine with random values stored in the memory and register file.
5. Following from 3, you can load the file with randomized memory by selecting “File” ↯ “Advanced Load” and selecting randomized registers/memory.
6. Do NOT execute any data as if it were an instruction (meaning you should put `.fills` after `HALT` or `RET`).
7. Do not add any comments beginning with `@plugin` or change any comments of this kind.
8. **Test your assembly.** Don't just assume it works and turn it in.

6 Rules and Regulations

6.1 General Rules

1. Although you may ask TAs for clarification, you are ultimately responsible for what you submit. As such, please start assignments early, and ask for help early. This means that (in the case of demos) you should come prepared to explain to the TA how any piece of code you submitted works, even if you copied it from the book or read about it on the internet.
2. If you find any problems with the assignment it would be greatly appreciated if you reported them to the author (which can be found at the top of the assignment). Announcements will be posted if the assignment changes.

6.2 Submission Conventions

1. Do not submit links to files. The autograder does not understand it, and we will not manually grade assignments submitted this way as it is easy to change the files after the submission period ends. You must submit all files listed in the **Deliverables** section individually to Gradescope as separate files.

6.3 Submission Guidelines

1. You are responsible for turning in assignments on time. This includes allowing for unforeseen circumstances. If you have an emergency let us know **IN ADVANCE** of the due time supplying documentation (i.e. note from the dean, doctor's note, etc). Extensions will only be granted to those who contact us in advance of the deadline and no extensions will be made after the due date.
2. You are also responsible for ensuring that what you turned in is what you meant to turn in. After submitting you should be sure to download your submission into a brand new folder and test if it works. No excuses if you submit the wrong files, what you turn in is what we grade. In addition, your assignment must be turned in via Canvas/Gradescope. Under no circumstances whatsoever we will accept any email submission of an assignment. Note: if you were granted an extension you will still turn in the assignment over Canvas/Gradescope.

6.4 Syllabus Excerpt on Academic Misconduct

Academic misconduct is taken very seriously in this class. Quizzes, timed labs and the final examination are individual work.

Homework assignments are collaborative, In addition many if not all homework assignments will be evaluated via demo or code review. During this evaluation, you will be expected to be able to explain every aspect of your submission. Homework assignments will also be examined using computer programs to find evidence of unauthorized collaboration.

What is unauthorized collaboration? Each individual programming assignment should be coded by you. You may work with others, but each student should be turning in their own version of the assignment. Submissions that are essentially identical will receive a zero and will be sent to the Dean of Students' Office of Academic Integrity. Submissions that are copies that have been superficially modified to conceal that they are copies are also considered unauthorized collaboration.

You are expressly forbidden to supply a copy of your homework to another student via electronic means. This includes simply e-mailing it to them so they can look at it. If you supply an electronic copy of your homework to another student and they are charged with copying, you will also be charged. This includes storing your code on any site which would allow other parties to obtain your code such as but not limited to public repositories (Github), pastebin, etc. If you would like to use version control, use [github.gatech.edu](https://github.com)

6.5 Is collaboration allowed?

Collaboration is allowed on a high level, meaning that you may discuss design points and concepts relevant to the homework with your peers, share algorithms and pseudo-code, as well as help each other debug code. What you shouldn't be doing, however, is pair programming where you collaborate with each other on a single instance of the code. Furthermore, sending an electronic copy of your homework to another student for them to look at and figure out what is wrong with their code is not an acceptable way to help them, because it is frequently the case that the recipient will simply modify the code and submit it as their own.
